# MOTIVATION AND SUMMARY

Online semester is too hectic and sometimes students forget about some tasks which they wanted to do. We believe that an organized work with somewhat less effort is more efficient than an unorganized work with more effort. There is also lot of pressure on students in online semester as they have to learn vast amounts of topics in a very short time. Students spend a lot of their time searching on the internet for good content which can complement with their studies. Searching for good content takes time. There are lot of resources available on the internet but an unbiased opinion is important. If students already know what are the useful resources, then it can save their time. Many a times students want to create some kind of to-do list which can help them in organizing their work. So, we wanted to create an app which can help students organize their studies by taking into consideration the present needs of students. The four main features of our app are 1. To-do list 2. Exam Reminder 3. Resource Manager 4. Time-Table. We have summarized all the features below.
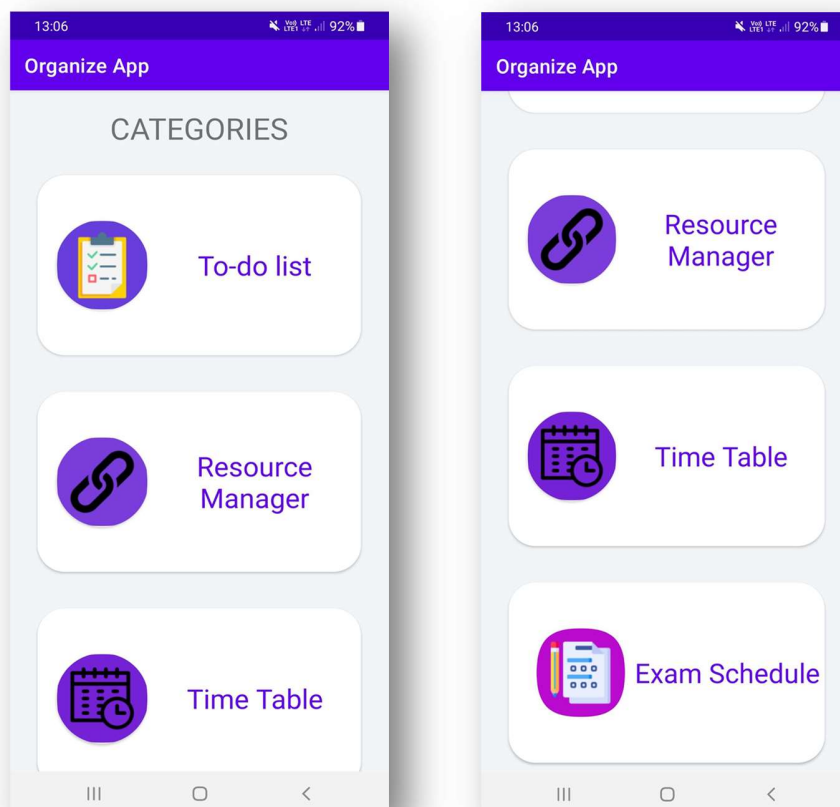

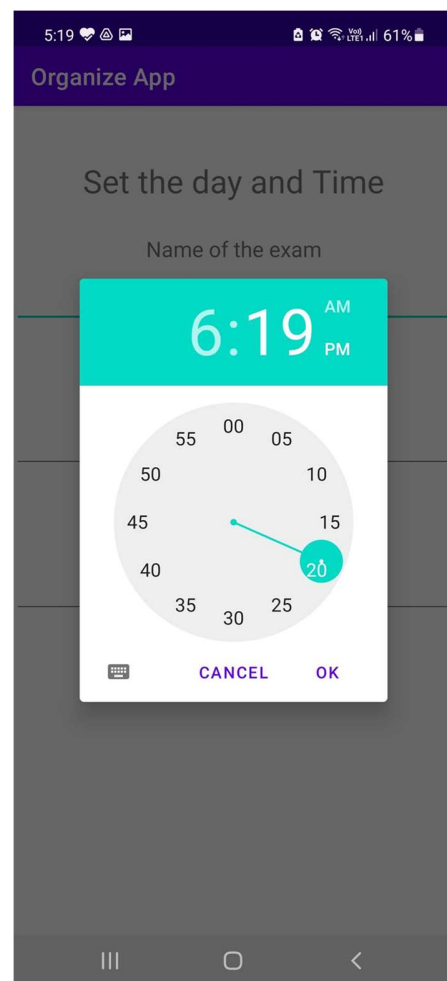

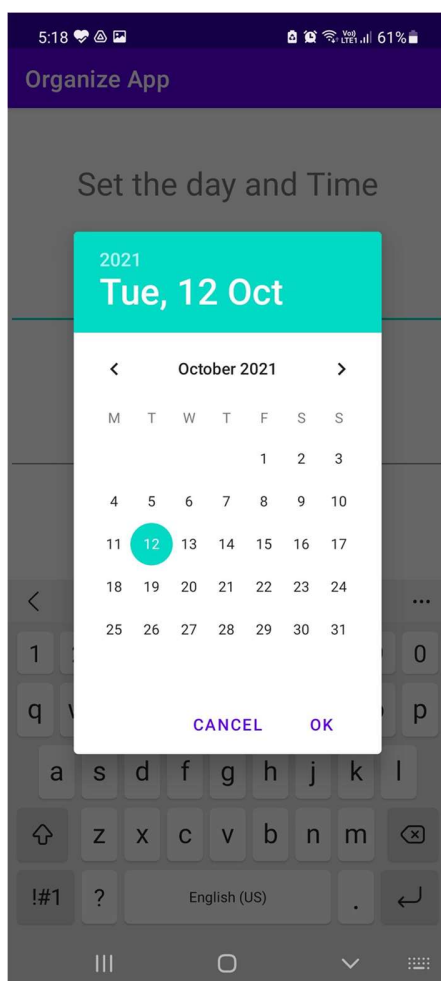

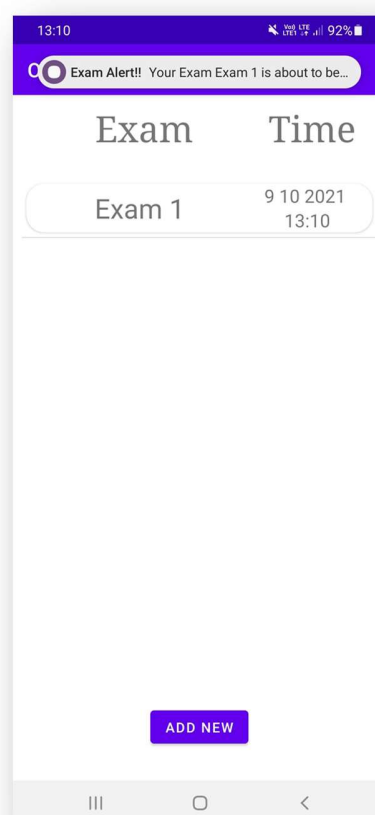

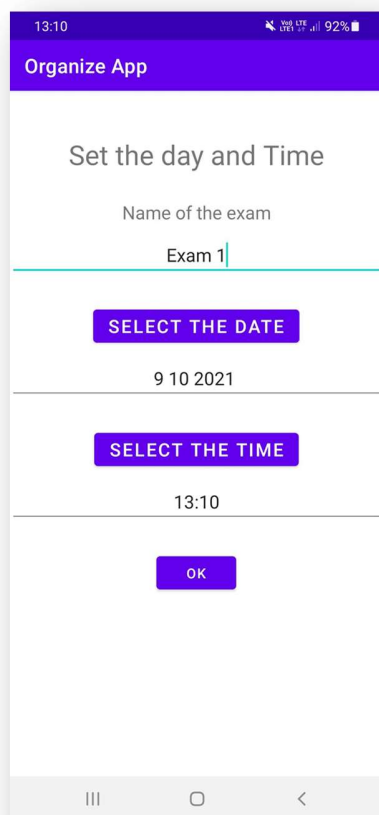

TO-DO LIST

It is a simple feature which allows user to make a list of tasks which they want to do. Users simply have to enter the information about the task in the textbox and hit the add button. When they finish a task, they just check it. At the end of the day the user can see what are the tasks they had accomplished.
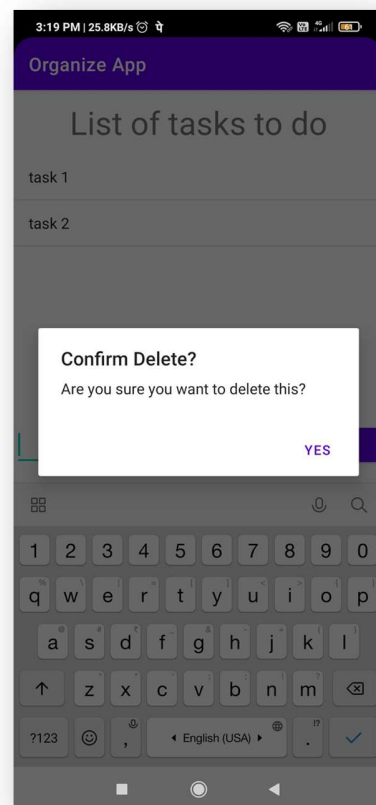

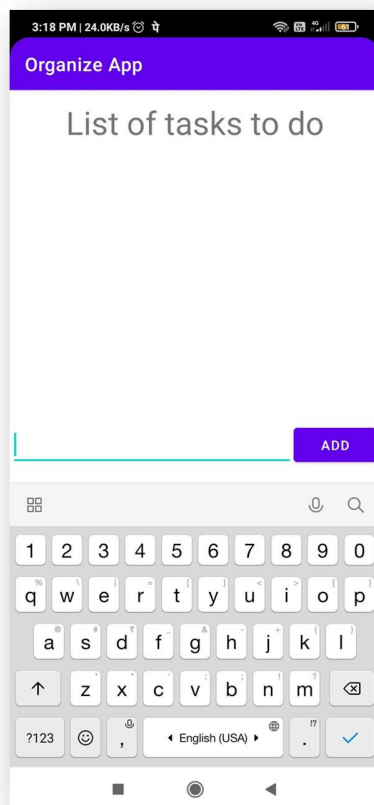

EXAM SCHEDULE

In this feature user can set alarm for various exams which they have to give. A few minutes before the exam an alarm goes Onn and a notification is popped which alarms the user about the examination. We can use this feature by simply entering the name of the exam, the day of the exam, the time of the exam.

TIME TABLE

In this feature user can enter the tasks which he/she does on weekly basis. There are seven days from Monday to Sunday and they can just simply enter in each day what the list of tasks which they have to perform.
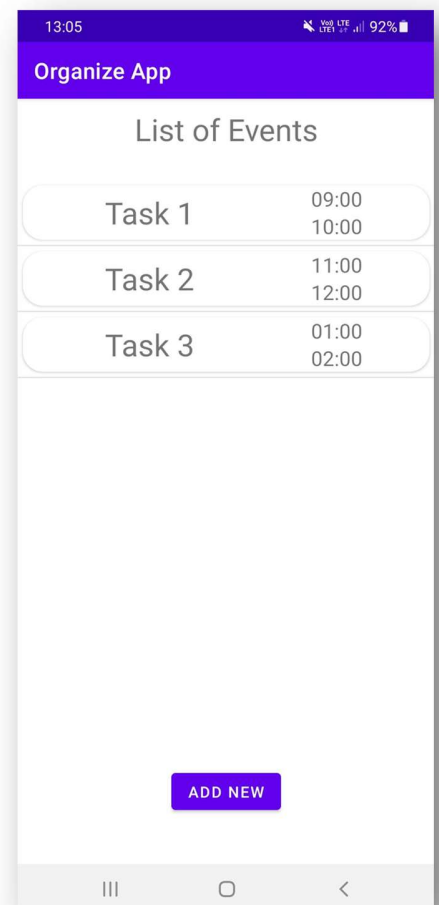

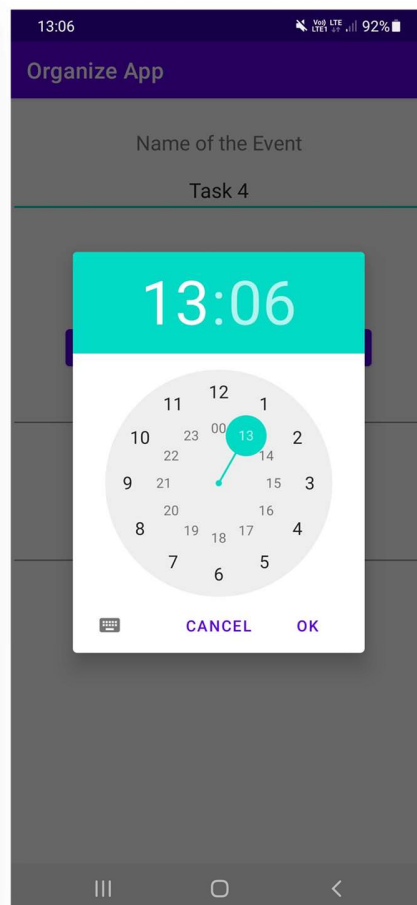

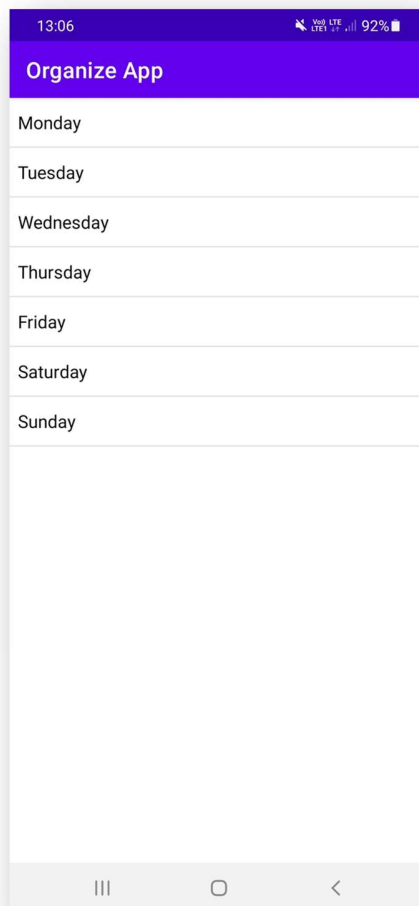

RESOURCE MANAGER

If a student wants to learn some subject which is not taught in his school or wants to learn the subject online because he/she is unable to follow his/her school teacher or wants to gain more information about the subject, one option is to study from some videos on YouTube or google search the topic which leads to some websites. But say after some years, a student feels the need to revise or wants to recommend some YouTube videos / websites to some other student who is willing to learn it fresh, then Resource Manager can come to help. In this feature user can store the links which he/she feels important then refer to these later on. This is similar to Google's bookmark feature but with some more features. Users can also share it to others. An important feature is that user can also rate websites, Videos visited. This will save time. To use this feature user simply has to enter the name of topic, the link, rating, comments.
